

TWINLODE®

Rack Systems
For Double-Wide loads

Twinlode is a structural steel racking system that improves upon conventional rack designs through the use of the double-wide concept. With Twinlode, pallets are neatly and safely stacked in steel beamed shelves which allows higher and deeper stacking capabilities. The benefits of the Twinlode system include increased warehouse utilization and reduced product and pallet damage.

TWINLODE[®]

Twinlode increases productivity.

The Twinlode drive-in rack system, designed around the double-wide concept, allows two-at-a-time, side-by-side pallet transport and storage. Using double or single/double forklift attachments from trailer to rack, Twinlode can increase your productivity by over 50%.

Twinlode maximizes storage space.

Because Twinlode allows you to store pallets side-by-side, an additional upright in every pallet position is eliminated. This gives you more pallet storage. Wider bay widths also keep the forklifts farther away from the uprights, eliminating damage to your rack system.

Twinlode is proven.

Twinlode has hundreds of thousands of pallet positions in service worldwide with customers both large and small.

Twinlode provides an attractive return on investment.

Twinlode lowers your labor and equipment costs, reduces the need for additional square footage and eliminates shuttle costs. The Twinlode rack system pays for itself and more! It's a much more viable alternative to building or leasing additional space.

Choose the Twinlode Rack System right for your warehouse.

Twinlode is available in our standard structural c-channel. It can be custom designed for any application, to accommodate any size pallet or load. Twinlode finishes include our standard electrostatic paint in your choice of many colors, powder coat or hot-dipped galvanized.

Call or e-mail to discuss your needs.
